LANCASTER COUNTY
CORRECTIONAL FACILITY

Introduction & Methodology

The County of Lancaster, Pennsylvania, has recognized the need to build a new correctional facility to meet the needs of its justice system. A consultant team led by CGL has been contracted to represent the County in the effort to replace the current facility, which dates back to the mid-nineteenth century. One task is to prepare a Needs Assessment to profile the Lancaster County Prison population, assess justice system conditions, and forecast the County Prison needs. The JFA Institute (JFA) assisted the Team in conducting the assessment.

The Needs Assessment provides analysis of the Lancaster County criminal justice trends with special attention directed at the local prison population. The analysis is based on both aggregate and individual level data provided by the County Prison. Collectively, these data are used to construct a simulation model of the Lancaster County prison. From this model a forecast of the prison population was produced. The model is most reliable for projections up to 10 years, but the forecast was carried out to 2050 as requested by the County. The simulation model JFA used to forecast the Lancaster County Prison population was built using the Wizard projection software, illustrated in Figure 1. This computerized simulation model mimics the flow of detainees through the local prison system over a ten-year forecast horizon and produces monthly projections.

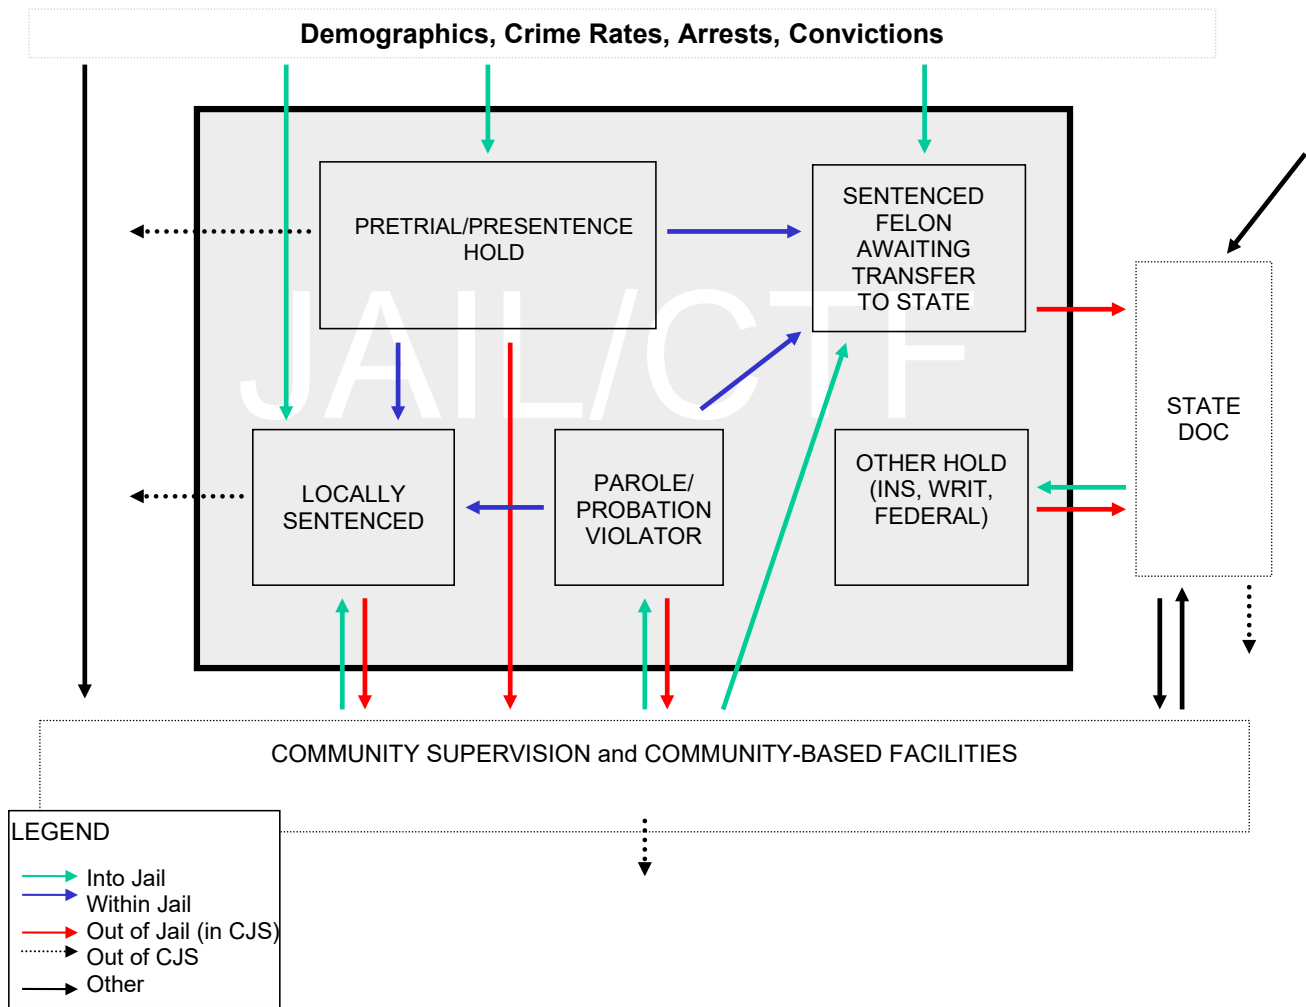

Because Wizard attempts to mirror the County's system, it must include a wide array of data that have both a direct and indirect impact on local prison population growth. A variety of factors underpin a correctional system's long-term projection. These factors can be separated into two major categories – external and internal.

External factors reflect the interplay of demographic, socio-economic and crime trends that produce arrests, and offenders' initial entry into the criminal justice process.

Internal factors reflect the various decision points within the criminal justice system that cumulatively determine local prison admissions and length of stay (LOS). These decisions begin with police and end with County officials who, within the context of the court-imposed sentences, have the authority to release, recommit, give and restore a wide array of good time credits, and offer programs that may reduce re-arrest and re-conviction.

The data JFA collected from the County encompasses these two factors. The purpose of collecting aggregate data was to examine County demographic, crime, arrest, local prison bookings and local prison population trends over time. JFA also received two local prison extract data files. One file consisted of a snapshot of the local prison population on September 30, 2022. The other file consisted of all local prison releases for calendar-year 2019 and the most recent 12 months. Two timeframes for the release file allowed for analysis of the impact of the COVID-19 pandemic on the Lancaster County Prison system by comparison of pre-COVID-19 (2019) and post-COVID-19 attributes and statistics. All files were provided by the Lancaster County Prison with data available from the data system.

Figure 1 - Projection Simulation Model

The snapshot of local prison population data allowed JFA to quantitatively understand the attributes of the population that must be housed and managed daily. The snapshot file was also used to profile the local prison population in terms of their socio-demographic attributes, number and type of charges, bail amounts and classification level. The release data were used to track detainees from booking to release to determine the number of persons that entered the local prison, the length of time that they remained, and the timing and mode by which they were released.

To augment these data, the Team conducted interviews with Lancaster County court, local prison, and general government officials. In addition, the Team conducted a Public Listening Session in October.

The simplest explanation of how the simulation model works is as follows. The size of the population is the product of the admissions and the inmate's length of stay (LOS). This can be simply stated in the following equation.

$$\text{Admissions} \times \text{LOS} = \text{ADP (Average Daily Population or Average Local prison Population)} / 365.25$$

Minor changes in either or both of these two factors can have an enormous impact on the ADP. For example, there were approximately 4,981 bookings (regular admits and central booking detainees) into the Lancaster County Prison in 2021. The average length of stay of releases from the local prison in 2021 was 51 days. Using the simple calculation of Admissions x LOS, the daily population is estimated to be 700. If the number of admissions remained constant, but the LOS was reduced by an average of 3 days, the average daily population (ADP) would drop by nearly 50 persons. Conversely, if the LOS was increased by three days, the local prison population would increase by the same amount.

These examples illustrate just how sensitive the local prison system is to law enforcement, court processing, and sentencing practices. Of course, if the number of admissions increased or decreased with no change in LOS, the population would also increase or decrease, respectively. From this baseline methodology, the Wizard simulation model adds complexity and increases the accuracy of forecasting a local prison population by disaggregating the population into key groups with similar paths through the justice system. The Wizard Simulation model is an example of a stochastic entity in the sense that the model is conceptually designed around the movement of individual cases (detainees) into, through, and out of a local prison. The model also makes use of the Monte Carlo simulation techniques by adding an element of randomness to the simulation model. Random numbers are generated and used by the simulation process to determine the offender group composition and lengths of stay associated with a system. Individual cases are processed by the model through a series of probability distribution arrays or matrices that provide computations for specific cases. When loaded with accurate data, the model mimics the flow of detainees through a local prison system and produces a monthly forecast accurate to within 2 percent.

Stakeholder Engagement

To augment the data analysis, CGL and JFA conducted interviews with more than 29 Lancaster County court, local prison, and general government officials. These interviews were geared towards expanding the Team’s understanding of the most influential factors on the detainee population not observable from the various data sources. This information included the impact of law enforcement practices and policies, court processing policies, and recently enacted sentencing laws. Such information is usually very complex in nature and warrants examination to accurately construct a simulation model of the County’s Prison system.

A list of the various stakeholders is provided in the following figure.

Figure 2 - Lancaster County Stakeholders

▪ Advisory Committee	▪ County Commissioner Trescot	▪ Juvenile Probation
▪ Adult Probation & Parole Services	▪ County Information Technology	▪ President/District Judge
▪ Bail Administrators	▪ County Warden	▪ PrimeCare Medical
▪ Behavioral Health & Development Services	▪ Clerk of Courts	▪ Prothonotary
▪ Chief Probation Officer	▪ Children & Youth Agency	▪ Public Defender’s Office
▪ County Administration	▪ Domestic Relations	▪ Sheriff’s Office
▪ County Commissioner D’Agostino	▪ Drug & Alcohol Commission	▪ Victim/Witness Service
▪ County Commissioner Parsons	▪ District Attorney’s Office	▪ Youth Intervention Center

The stakeholders identified several criminal justice system initiatives that are positively impacting the jail population.

- ❖ County and Court strong support for three treatment courts – Adult Drug, Mental Health, and Veteran’s.
- ❖ District Court Administration large participation in Treatment Courts and Domestic Violence and DUI court.
- ❖ Drug and Alcohol Commission participation in the Recovery Advocacy Service Empowerment (RASE) program to place individuals from the prison and into residential treatment facilities to overcome drug and alcohol addictions.
- ❖ Chaplain volunteer program providing 30 different programs in facility.

- ❖ Probation & Parole working with re-entry officers to assist finding housing for inmates upon release.
- ❖ Mental Illness/Substance Abuse (MISA) program being administered by a mental health task force with goal to provide inmates seriously mentally ill the opportunity to receive treatment for mental health and substance abuse while in jail and to be transitioned into residential treatment as quickly as possible.
- ❖ District Attorney started a new diversion program “Pathways to Recovery” in June 2022 for individuals who commit low-level offenses related to drug & alcohol addiction.

The findings and results of the Needs Assessment were presented to various stakeholder groups throughout the data gathering, analysis, and projection development process.

CGL and the project Advisory Committee hosted a county-wide listening session on September 21, 2022. In addition to commenting about details related to location and timing of future listening sessions, the following themes were raised by community members:

Project Programming and Design

- Needs Assessment. People inquired on how the data for establishing who is in the facility was being gathered. They also commented on the high percentage of people they felt were there in pretrial circumstances asking what was being done to get them back home and at their jobs.
- Space and Programming. Many of the speakers addressed the need for space to conduct classes, host religious ceremonies, group therapy, and allow for confidential treatment (such as sexual assault consultation). Others spoke about the need for a transitional space for the time before their date of their release to get them ready to go out into society again.
- Design of Facility. Neighbors near the site expressed comments about having a design that would be “nice to live next to” and fit in with the neighborhoods nearby. They also voiced concerns about increased traffic and how that would be mitigated with the new facility. People spoke about the importance of natural light and nature to assist with healing for those incarcerated.

Criminal Justice Trends

- Mental and Behavioral Health. The public recognized the increase of behavioral and mental health conditions with the inmates and detainees and asked questions about how the new facility would address these issues.
- Reasons for Incarceration. Public comments were given about the reasons for incarceration and focused on ways to reduce placing people in jail. People spoke about false convictions along with the impacts to an individual’s mental health once incarcerated. People also spoke about increased opportunities for diversion.

Key County Trends

This section details the internal and external factors driving the Lancaster County Prison population as gleaned from the data and subsequently input into the simulation model.

County Population Growth

Criminologists have long noted that certain segments of the population have higher rates or chances of becoming involved in crime, being arrested, and being incarcerated. This is known as the “at-risk” population, which generally consists of younger males. The high crime rate ages are 15-25, while the high adult incarceration rate is between the ages of 18 and 44. When the at-risk population is expected to increase in a jurisdiction, one can also expect some additional pressure on criminal justice resources, all things being equal.

Figure 3 provides data on the total resident population and at-risk estimates for Lancaster County from 2015 to 2021. Over this time frame, the total resident population has increased by an annual average of only 1.0%. The at-risk population, here designated as males ages 15-44, has also remained static between 2015 to 2021, also growing by an annual average of only 1.0%. Up to date projections of these populations are also provided. Three resident population forecasts are displayed. For simplicity, the “middle” forecast is chosen here for analysis. If analysis is based strictly on the historical estimates, the fact that the at-risk population has seen little to no growth in recent years would suggest that the impact of this population on future reported crime will be minimal. The forecasted resident population predicts the number of residents in the County to grow by 11% overall between 2021 and 2040. This is slightly lower than projections for the nation-as-a-whole. Slow growth in the resident population would indicate, strictly on the basis of the number of persons residing in the county, that future increases will not be substantial enough to put pressure on either the crime rate or the local prison population.

Figure 3 - Historical & Projected Resident Population

Historical Reported Crimes and Arrests

Reported crime and arrest data reported in Tables 1 and 2 refer to offenses reported by law enforcement agencies to the Pennsylvania Uniform Crime Reporting System. Although, historically, there has been no strong or consistent association between reported crime rates and local prison admissions, observing these data can provide some anecdotal evidence that allows insight into county local prison admission trends. It should be noted here that the Pennsylvania Uniform Crime Reporting System includes simple assaults. This offense is excluded when calculating crimes per 100,000 residents for Lancaster County (the crime index) here as they are not traditionally included in Uniform Crime Reporting of violent crime levels and their inclusion would inflate the County’s crime rates.

The total number of Part I reported crimes between 2015 and 2021 in Lancaster County has experienced a sizeable decline. The average annual change over this time period was -12%. Violent crimes have seen an average annual decrease of 9% while property crimes had an average annual decrease of 13%. The impact of the COVID-19 pandemic can be seen in the single year declines in 2020 and 2021. However, the overall trend began pre-COVID-19 with 2018 and 2019 both seeing declines.

Table 1 - Historical Reported Crime

Attribute	2015	2016	2017	2018	2019	2020	2021	Average Percent Change
Murder & Negligent Manslaughter	16	8	15	12	14	12	9	-1%

At Risk Population (Males 15-44)	100,295	100,583	101,208	101,735	102,143	103,869	104,581	1%

Source: www.ucr.pa.gov

There is a much stronger relationship between arrests, compared to crimes, and the number of persons admitted to a local prison system since a high proportion of arrests result in a local prison booking. Total arrests trends have mirrored reported crime in recent years in Lancaster County. Total arrests (for both Part I and Part II crimes) decreased an annual average of 10% between 2015 and 2021. While arrests for Part I violent offenses have seen in an increasing trajectory between 2015 and 2021 (up an annual average of 3%), both Part I property arrests and Part II arrests have been decreasing consistently. It should be noted that increases in violent arrests can impact a local prison population, as persons held for violent crimes generally have longer average lengths of stay. The impact of declining arrests on local prison bookings would indicate a decreasing volume of bookings per year.

The average annual increase in the number of arrests for Group A offenses (all serious violent and property crimes reported to The Arkansas Crime Information Center) was 2.4%. The total number of arrests has fluctuated in recent years and shows no clear trends. With arrest numbers being inconsistent from year to year, it is difficult to link them to historical local prison bookings.

Table 2 - Historical Arrests

Attribute	2015	2016	2017	2018	2019	2020	2021	Average Percent Change
Murder & Neglegent Manslaughter	11	8	11	11	15	10	6	-4%

Source: www.ucr.pa.gov

Crime Rate

The County’s crime rate per 100,000 residents in 2021 was 645.9 (Table 3). This was significantly lower than the crime rate statewide. Furthermore, Lancaster’s crime rates have been declining at an increased rate since 2015 compared to Pennsylvania as a whole. As seen in Figure 4, the County crime rates have been declining since 2018 even as the resident population grows.

Both reported crime and arrests have been consistently declining and the resident at-risk population has seen stagnant growth in recent years. One would not expect to see a remarkable change in any of these trends in upcoming years and thus their impact on the future local prison population is assumed to be minimal. Of note, however, are the recent increases in Part I Violent arrests which could fuel increases in the local prison population.

Table 3 - Historical Crime Rates per 100,000 Residents

Year	PA Violent	PA Property	PA Total Crime	County Violent	County Property	County Total
2015	315.4	1,813.2	2,128.6	185.1	1,444.0	1,629.1
2016	315.9	1,739.2	2,055.1	180.2	1,401.8	1,582.1
2017	313.0	1,644.3	1,957.3	212.6	1,348.0	1,560.6
2018	305.4	1,489.2	1,794.6	178.9	1,122.5	1,301.4
2019	306.0	1,403.8	1,709.8	172.8	1,029.5	1,202.3
2020	389.5	1,644.1	2,033.6	132.5	787.9	920.4
2021	-	-	-	72.1	573.8	645.9
<i>Average Percent Change</i>	5%	-2%	0%	-12%	-14%	-14%

Figure 4 - Historical Crime Rates and Resident Population

Historical County Prison Population Trends

Table 4 presents historical bookings to the Lancaster County Prison by type and details the ADP with peaking factor between 2017 and 2022. Figure 5 also displays the ADP with peaking factor. The population peaking factor is a rough estimate of maximum bed-space needs based on the actual ADP. It is defined as the percentage that the population peak for the year was above the daily average. It should be noted that this peaking factor does not include a classification factor which is typically added to ensure the right security level of beds are available for use by the local prison at any given time. Due to limited data availability, JFA was unable to quantify an exact classification factor for the Lancaster local prison, however, typically combined classification and population peaking factors average an additional 15 percent of the ADP.

Bookings sharply decreased in 2020 likely due to mitigation efforts put in place in response to the COVID-19 pandemic. The lower volume of bookings seen in 2020 was sustained through 2021 and, early indicators show, 2022. Most bookings are admissions to the County Prison (versus the Central Booking Detainees) although both groups show the same trends.

The ADP for the same time period shows a similar trend to bookings with the ADP decreasing in 2020, although not to the same degree as bookings. Table 4 shows the average LOS for each year. The decrease in ADP was tempered by a corresponding increase in the average length of stay. The LOS in the local prison increased sharply in 2020 from 35 days in 2019 to 50 days. Again, the COVID-19 pandemic is the culprit. Mitigation efforts nationwide led to a “hardening” of jail populations as many low severity misdemeanor and non-violent felony defendants were released increasing the proportion of persons held with poor criminal histories and violent felony charges. Persons with these attributes average longer stays in jail. Further, average lengths of stay increased during the pandemic due to a slowdown in the disposition of criminal charges (court case processing).

While historical ADP trends are important to document and report on annually, it should be noted that it is unclear if the population has fully stabilized at the lows seen since 2020. Many factors will be at play as the court system continues to ramp up and a new normal comes into clearer focus in relation to arrest rates.

Table 4 - Historical County Prison Bookings by Type 2017-2022

Year	Admits	Calculated Admits LOS (days)	Central Booking Detainees	Detainee LOS (hours)	Total	Calculated Total LOS (days)	ADP	Peaking Factor	ADP with Peak
2017	5,726	56	2,673	10.9	8,399	38	884	13%	997
2018	6,166	52	2,535	7.5	8,701	37	876	11%	970
2019	5,973	48	2,307	8.4	8,280	35	789	8%	854
2020	3,501	70	1,423	8.1	4,924	50	677	16%	788
2021	3,753	68	1,228	8.2	4,981	51	700	11%	775
2022 (ann'd)	3,756	74	1,063	7.7	4,819	58	765	4%	796
<i>Average Percent Change</i>	-5.9%	7.5%	-15.9%	-5.5%	-8.8%	10.0%	-2.5%	-7.4%	-4.3%

Analysis of the Lancaster County Prison Snapshot

Tables 5 through 9 display data on persons housed in the Lancaster County Prison on September 30, 2022. As mentioned previously, these data assist JFA in understanding the attributes of the local prison population that must be housed and managed daily. Table 5 provides a demographic profile and Table 6 describes the local prison population by most serious offense. Table 7 details the population by classification level. Table 8 describes attributes and behavioral needs gleaned from the Level of Service Indicator-Revised assessment. The intake assessment is a quantitative survey of offender attributes and offender situations relevant for making decisions about levels of supervision and treatment. Table 9 details the historical medical and mental health needs of the local prison population.

A pre-COVID-19 snapshot was not available due to data system limitations. Thus, a pre/post pandemic comparison of snapshots is not provided.

Summary of Attributes of County Prison Population on September 30, 2022

1. Much of the local prison population was male (85%). Males had a significantly longer average length of stay to date than females (180 days for males versus 107 days for females).
2. The average age of persons in the local prison was 37.5 years. The majority of persons were ages 25 through 44.
3. The largest portion of the local prison population by race was White (50%).
4. A majority of persons had no bond (58%). Persons held for a bond of over \$10,000 had the longest average length of stay to date (278 days).
5. A majority of persons are awaiting court action (69%). This group has a longer length of stay so far than locally sentenced persons. This is likely because a large portion of the population is being held for a most serious charge of violent felony. The disposition of such cases takes longer, and these persons are more likely to remain in custody during the court processing period.
6. A large portion of the population was admitted as county probation violators (30%). This is an unusually large proportion for a local detention facility.
7. Persons that had been held in the local prison for greater than six months accounted for 29% of all the local prison population.

Summary of County Prison Population by Most Serious Offense on September 30, 2022

1. Charge level data (felony versus misdemeanor) was not available due to data system limitations. This limited the capacity to determine how “hard” the jail population is. While a vast majority are held for a most serious charge that was violent in nature, charge level would have provided an additional layer of detail.
2. Persons held for a murder, sex or assault charge had the longest average length of stay so far. Assault charges were the largest single category (21%) and averaged a length of stay to date of 181 days, slightly above 168 days, the average of all persons held.
3. Felony probation/parole violators accounted for 5% of the detainee population and had an average length of stay to date of 51.1 days.
4. Persons held for a drug sale/trafficking charge comprised 12% of the population and averaged a length of stay to date of 186 days.
5. Persons held for any property charge comprised 18% of the population and collectively averaged a length of stay to date of 98 days.
6. As seen in Table 7, one-third of the jail is classified under maximum security housing.

Summary of County Prison Population by Behavioral & Medical Needs on September 30, 2022

1. Intake assessment scoring shows that 83% of the population has a previous State prison incarceration.
2. Intake assessment scoring shows that 36% of the population has previously received treatment for mental health and 56% have a history of substance abuse. It is important to note that the intake assessment scoring is determined by a mix of self-reporting and available records. This may limit the accuracy of scoring, but the intake assessment results still provide a general description of needs for a population.
3. Intake assessment scoring shows that 17% of persons held consider themselves to be homeless.
4. From summary reports provided by Prime Care Medical Inc., additional descriptions of mental health and medical needs can be gleaned (Table 9). Over the last five years, the number of medical consultations has increased an annual average of 22%, the most significant increases occurring in 2021 and 2022. It is unclear if this is related to the pandemic or an increase in available services.
5. The proportion of persons on medical medication has increased by an annual average of 16% per year for the past five years and averaged 46% of the population for those five years.
6. The proportion of inmates receiving mental health treatment while in the Lancaster County Prison and the proportion of those diagnosed with a serious mental illness have both increased over the last five years. Persons receiving treatment averaged 39% of the population between 2018 and 2022 while those diagnosed with a serious mental illness averaged 7%.

Table 5 - Attributes of County Prison Population (September 30, 2022)

Attribute	Number	Percent	Average Length of Stay (days)
Total	817	100.0%	168.3
Gender			
Female	120	14.7%	107.4
Male	697	85.3%	178.9
Race			
Black	172	21.1%	178.3
Hispanic	212	25.9%	189.7
White	412	50.4%	151.7

Analysis of Lancaster County Prison Releases

Tables 10 through 13 detail findings concerning persons released from the Lancaster County Prison in calendar year 2019 and from the most recent 12 months prior to September 12, 2022. As discussed previously, release data assists JFA in determining the number of persons entering the local prison, the length of time that they remain, and the timing and mode by which they are released.

General Attributes of Releases over the last 12 months

1. Most releases were male (79%) and had a length of stay of 83 days. Female releases averaged a significantly shorter LOS (44 days). Overall, the average stay for all releases was 74 days. Adding in central booking detainees to produce a comparable figure, the total LOS of all individual brought to the LCP is 58 days, is significantly longer than the national average of 35 days for 2022.
2. Blacks and Hispanics averaged a longer LOS than Whites.
3. Releases without a bond set averaged a stay in the local prison of 66 days. Releases with a bond of \$10,000 or more had an LOS of 115 days.
4. Persons released awaiting court action (64% of releases) had an ALOS of 34 days while sentenced persons (34% of releases) averaged 154 days.
5. Releases that were booked as a County Probation Violator comprised 26% of releases and had an ALOS of 75 days.

Releases over the last 12 months by Most Serious Charge

1. As expected, releases of persons charged with a violent offense had the longest ALOS (119 days).
2. Releases categorized in the assault charge group comprised 12% of releases with an ALOS of 110 days.
3. Releases with a most serious charge of drug sale/trafficking had an ALOS of 117 days. This charge group comprised 9% of releases.
4. Releases with a top charge of theft comprised 8% of releases with an ALOS of 50 days.

Releases over the last 12 months by Release Reasons & Length of Stay

1. The 3,677 release events from the Lancaster County Prison were generated by 4,780 persons of which 973 (or 20%) were released more than once.
2. The vast majority of releases (60%) occurred after 10 days from booking.
3. The primary release reason was 'Paroled.' This group comprised 33% of releases and had an average length of stay of 92 days.
4. Releases exiting due to being "Sentenced to DOC" comprised 7 percent of releases but had, by far, the longest ALOS of 325 days.

5. "Paroled" and "Sentenced to DOC" releases are the drivers of the Lancaster County Prison population. These two groups make up 73% of the beds in the system on any given day.

Comparison of the pre-COVID-19 (CY 2019) and post-COVID-19 (most recent 12 months) Release Cohorts

1. CY 2019 releases had an ALOS of 48 days, 56% lower than post-COVID-19. This is primarily due to case processing back-logs caused by the pandemic.
2. The proportion of releases when examining gender, race, and age did not see any significant differences between cohorts.
3. The proportion of locally sentenced bookings decreased post-COVID-19.
4. Differences in the volume of releases by release reason were negligible between cohorts excepting "Bench Warrant Dismissed" which increased post-COVID-19.
5. The proportion of releases exiting after a stay of 30 days or more increased post-COVID-19.

Prison Population Forecasts

This section presents the local prison forecasts and the key assumptions that have a significant impact on all the projections results. In making these estimates we utilized the Wizard projection software to generate forecasts of correctional populations. The Wizard software mimics the flow of persons through the County's system over a forecast horizon ending in 2050 and produces yearly projections of the average daily population. The base assumption for the simulation model is that most conditions in the jail, including profile of individuals admitted, LOS and release practices will remain constant and reflect data presented in the above report.

Tables 14 and 15 present the forecasts generated from this model. The forecasts are also presented in Figures 6 and 7, respectively. The Table 14 forecast is a baseline projection and an alternative to this baseline. Table 15 presents an alternative "classification" forecast and also includes peaking factor. Figure 8 provides forecasts of the Baseline ADP with peaking factor included and a forecast of central booking detainee admission and ADP for space planning purposes.

The baseline forecast projects the Lancaster County Prison ADP to grow at an average annual rate of only 0.7% between 2023 and 2050. The forecasted ADP in 2050 is 909. The alternative projection to the baseline predicts a mildly higher average annual increase of 1.0% ending with an ADP of 947 in 2050. Both the baseline and alternative forecast assume no substantial changes to the make-up of admissions into the facility (i.e., gender, age, most serious charge, admission reason, release reason, etc.) throughout the forecast period. Additional assumptions separating the baseline and alternative forecast are presented below:

1. The baseline forecast model assumes the total number of admissions to the facility will grow at an average rate similar to the EDC #1 demographic forecast and the LOS will remain at 2021 levels.
2. The alternative assumption assumes the total number of admissions will rebound to levels similar to 2019 over the next 3 years. During that time, LOS will also decrease 20% from 2021 levels.

The resulting forecasts are very similar in growth and ultimate capacity needs, with increased differential in the next three years.

The classification with peaking forecast model projects the Lancaster County Prison ADP to grow at an average annual rate of only 0.7% between 2023 and 2050. The forecasted ADP in 2050 is 1,219. The alternative projection to the classification with peaking predicts a mildly higher average annual increase of 1.0% ending with an ADP of 1,271 in 2050. Both the baseline and alternative forecast assume an 11.8% peaking factor and an additional 20% classification factor is applied to the ADP forecast to ensure the right number and type of beds are available in each forecast year.
